

ABSTRACT

METHOD AND SYSTEM FOR LICENSING A SOFTWARE PRODUCT

5 A method and system for activating and obtaining a license for a software product is disclosed. A local license is obtained from a storage medium of the software product and is stored with the software product on a user's computer. The local license allows for one of multiple license types to be activated from a single software product. The user enters a product key containing a channel ID. The compact disk or other storage medium
10 is searched for the appropriate local license for the channel ID. The local license includes a MSIID, a channel ID range for each supported license type, a license type for each channel id range, and an optional product expiration date for the license type. The license type is determined by looking up the product key's channel id in the local license's channel id range table. If activation is required based on the license type, then an
15 installation ID including a product ID (PID) and a hardware ID (H/W ID) are transmitted to an activation authority. The activation authority uses the PID to determine whether the software product has been activated before and uses the channel ID to determine the type of backend license to grant. If the PID is found in the database, the activation authority applies various unlocking rules to determine whether or not the backend license should be
20 issued and, if so, the he activation authority transmits a backend license.
